

TechniComm News No. 15 – SEPTEMBER 2006

“PDA INTERFACE”

To facilitate and further simplify the relationship between the user and the electronics present on the machine, Fassi has developed a specific programme for the utilisation of **PDA** as an interface.

In one hand there are therefore all the possibilities to relate with the electronic handling of the crane, to download the statistic data on its utilisation, to access menus of functional check of devices and parameters modification.

All the functions present in the previous programmes of utilisation on the traditional PC are now available in the PDA version.

A PDA version will also be available at customer's request.

It will be limited to the access of the download menus of the statistic data on crane utilisation and of the menus of functional check of the devices.

Advantages for the operator:

- With the PDA version, destined to the customer/operator, also the crane user will have the possibility to access to the menus of functional check of the components and to download the files concerning statistic data about crane utilisation. This information will better identify the crane maintenance times and will allow the operator to understand the eventual necessity to look for a bigger crane as the one actually in his hands always works at its capacity limits.

Advantages for the after-sales service:

- The advantage for the technicians of the after-sales service, besides the speed up of the operations compared to the manual utilisation of the control handle of the radio control or of the user panel, is a very reduced instrument, easy to be transported and with all the characteristics of a personal computer.
